## A DNA key to Swedish vertebrates – final report

Per G.P. Ericson, Dario Zuccon & Veronica Nyström Edmark

Department of Bioinformatics and Genetics, Swedish Museum of Natural History, P.O. Box 50007, SE-10405 Stockholm, Sweden.

### Background

The project “*A DNA key to Swedish vertebrates*” was carried out between 2006 and 2011 at the Molecular Systematics Laboratory (Swedish Museum of Natural History), NRM dnr 2006-00674. It focused on all vertebrates occurring regularly within the Swedish territory, i.e. mainland and adjacent waters. In accordance with the barcoding standards set out by the Consortium for the Barcode of Life (<http://www.barcoding.si.edu>), the COI gene was selected as the principal barcoding marker. In addition, a portion of the 16S rRNA gene was used as a secondary marker. The aim with the project was to demonstrate the power and usefulness of DNA barcoding by producing a DNA identification key for all Swedish vertebrates that can serve as tool for identifying animal and plant products subject to trade (both legal and illegal), fisheries management, nutrient control, etc.

A main report was written in April 2012 by Dario Zuccon who also conducted most of the laboratory work in the project. In the summer 2012 Veronica Nyström completed the report in several important aspects. Among other things, it included results from several species that had not been available to Zuccon and some taxonomic changes were also made in the tables. Nyström also describe some new primers and primer combinations that allowed the sequencing of species for which the amplification previously had failed, especially some bird species.

The texts in Zuccon’s and Nyström’s reports are partly overlapping and the current report combines them. The tables of number of sequenced species and individuals are from Nyström’s report. Also the detailed descriptions of laboratory methods and samples in section 6 are from Nyström’s report.

## Project “A DNA key to Swedish Vertebrates”

### 1. Introduction

All species can be identified by unique DNA sequences. DNA barcoding is a global initiative that aims to produce a catalogue of unique sequences for all the species of the world. DNA barcodes will allow non-specialists to accurately identify species, and since barcodes work on all life stages (eggs, sperm, seed, larvae), as well as on incomplete specimens or small fragments (food ingredients, forensic evidence, stomach contents), it can be used for a wide range of applications. Potential applications include food control, fisheries management and identification of products of animals and plants subject to restrictions in national and international trade (e.g., CITES).

The project “Barcoding the Swedish Vertebrates” has been carried out between 2006 and 2011 at the Molecular Systematics Laboratory (Swedish Museum of Natural History). It focused on all vertebrates occurring regularly within the Swedish territory, i.e. mainland and adjacent waters. In accordance with the barcoding standards set out by the Consortium for the Barcode of Life (<http://www.barcoding.si.edu>), the COI gene has been selected as the principal barcoding marker. In addition, a portion of the 16S rRNA gene has been used as a secondary marker.

We have demonstrated the power and usefulness of DNA barcoding by producing a DNA identification key for 75% of all Swedish vertebrates (491 out of 657 species). We have also established a model for continued barcoding activities in Sweden, by developing guidelines for collection and for long-term storage of vouchers and material intended for DNA studies. The DNA sequences are being published on the NRM website where it is also possible to compare unknown sequences with this new library of sequences from Swedish vertebrates. We will also make available at the website a guide, directed to collectors and end-users and adapted for Swedish conditions, produced to specify conditions for obtaining high quality tissue and appropriate procedures for PCR, amplification, sequencing, alignment and storage of sequencer output, tissue and vouchers.

### 2. Samples

Species inclusion criteria. The species included in the checklist of the terrestrial Vertebrates are those considered of regular occurrence within the Swedish territory and nearby waters, including allochthonous species with regular populations in Sweden. Vagrants, escapes or any other category of non-regular occurrence has been excluded. We used standard field guides to define the status of Swedish species for mammals, amphibians and reptiles. The bird checklist follows strictly the SFO checklist. The fish checklist has been provided by Sven Kullander.

Taxonomy. The bird taxonomy follows the Clement Checklist, in agreement with the ABBI recommendations. The fish taxonomy agrees with the FishBase checklist. For mammals, amphibians and reptiles we followed the traditional nomenclature. Before a publication/release of the barcoding data for these three classes a specialist should be consulted for an updated taxonomy, especially for bats, shrews and rodents.

Sample coverage. The sample coverage is good for mammals and birds only, rather good for fishes and poor for amphibians and reptiles (Table 1). In particular, for mammals, birds and fishes, all common or rather common species have been included in the barcoding project. The missing birds missing are either rare, occurring in low number as migrants, winter or summer visitors. For mammals, only few bats and shrews, and one dolphin are missing.

*Table 1:* Samples of Swedish vertebrates sequenced in the project until June 2012.

	Mammals	Birds	Herps	Fishes
Swedish species	77	307	23	253
Species obtained	70 (88.6%)	275 (89.6%)	10 (43.5%)	159 (62.8%)
Species with 1 sample only	7 (8.9%)	38 (12.4%)	4 (17.4%)	34 (13.4%)
Species with 2+ samples	63 (79.7%)	238 (77.5%)	6 (26.1%)	125 (49.4%)
Missing species	9 (11.4%)	32 (10.4%)	13 (56.5%)	94 (37.2%)
Extracted samples	181	534	17	286
Sequences: 16S (completed)	177 (97.8%)	529 (99.1%)	16 (94.1%)	280 (97.9%)
Sequences: COI (completed)	175 (96.7%)	530 (99.3%)	14 (82.4%)	273 (95.5%)

Amphibians and reptiles are the least sampled groups, reflecting the lack of a specific tissue collection in the museum. All obtained samples were either animal found dead by staff members during the last two years, or provided thanks to the contact of Stefan Lundberg with an external research group. A few mammals and birds samples were obtained from Ajtte, Svenskt fjäll- och samemuseum (6 samples) and Göteborgs naturhistoriska museum (7 samples). The tissue samples are currently stored within the NRM tissue collections, while the vouchers remain in the respective original museum.

When multiple samples were available for a species, we selected the samples using three criteria: 1) presence of a voucher; 2) collection during the breeding season (birds only); 3) geographic origin.

The majority of terrestrial vertebrate samples have an associated voucher, and almost all fishes. The exception is represented by about 40 bat samples. They belong to two species difficult to identify morphologically, *Myotis brandti* and *M. mystacinus*. They were used as a test of the reliability of 16S as a barcoding marker (see below).

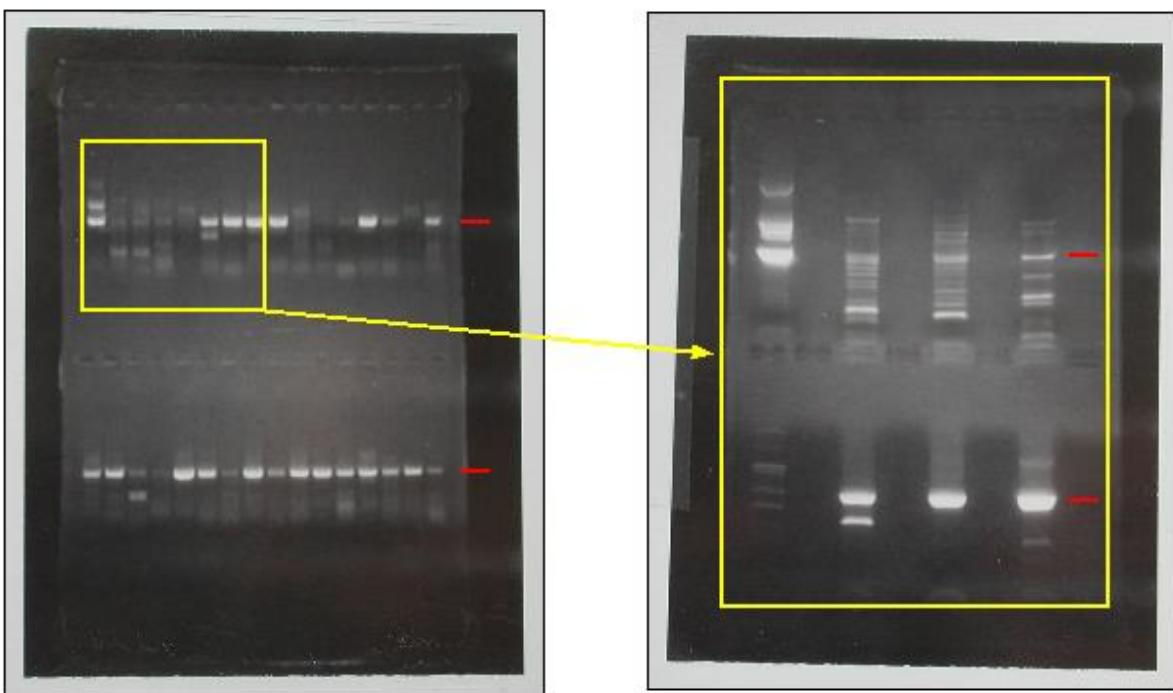

### 3. Sequencing COI

The selected barcoding region is a portion of the COI (cytochrome oxydase I) gene of 648bp, starting at position 58 of the mouse genome.

**Fishes.** The sequencing of COI in fishes proved to be easy and the published protocol by Ward et al. (2005) worked well. Ward et al. (2005) suggested four primers, a primary couple (FishF1 and FishR1), plus two alternative primers (FishF2 and FishR2).

With very few exceptions (<10 samples), the primers amplified a single, strong band. With the primary primer couple we amplified 80% of samples, and an additional 15% with one of the other primer combinations. Only 5% of samples did not produce any amplification product, the same proportion observed by Ward et al. (2005) for Australian fishes.

**Amphibians and Reptiles.** For amphibians and reptiles we followed the protocol of Smith et al. (2008). The protocol seems to be reliable, although the number of species tested is limited, only 10. We obtained good amplification products for all species but one. Both individuals of *Rana arvalis* did not produce any product, and it is possibly due to a primer mismatch.

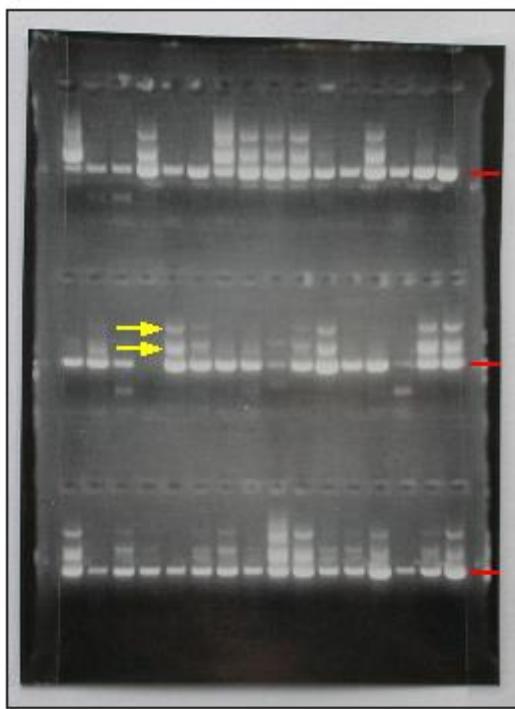

**Figure 1.** Left: results of the amplification of the COI gene for some birds species using the Hebert et al.'s (2004) protocol, visualised on a 0.8% agarose gel. Only a minority of samples produce a single bands. In many cases extra bands and primer dimmers are clearly visible. Right: the first eight samples from the left image are run on a 1.5% agarose gel to improve the band separation. Only one out of eight samples produces a single bands. Red tags indicate the size of the expected amplification products. The species in the left image are (left to right, top to bottom): *Corvus corax*, *Hirundo rustica*, *Loxia curvirostra*, *Motacilla alba*, *Anser anser*, *Buteo buteo*, *Strix nebulosa*, *Muscicapa striata*.

**Birds.** Contrary to several publishes statements, the sequencing of COI for birds proved to be extremely difficult, the published protocols unreliable and with poor repeatability. At first, we followed the indication of Hebert et al. (2004), but only a minority of samples generated a single, clean band of expected size. In most cases, the amplification according to the published protocol generated multiple bands (see Fig. 1). Changes in the amplification profile, either number of cycles, denaturation/annealing/ extension time, annealing temperature, did not produce any significant improvement. The amplification problems were taxonomically widespread, affecting all bird groups, but Anatidae appeared especially difficult to amplify.

Given the substantial failure of the published protocol, we developed a different strategy that proved to be efficient and reliable. We designed bird specific primers annealing on the two flanking tRNA and used these to amplify the entire COI gene. The amplification product of this PCR was used as template for a nested PCR using the standard primers suggested by Hebert et al. (2004).

With the new protocol we obtained sequences from all bird species. In several cases the nested PCR produces concatamers (Fig. 2), but these do not affect the quality of the sequences. However, we obtained pseudogenes for two species. One sample of *Glaucidium passerinum* produced a pseudogene, but the correct sequence was obtained with a different primer combination. Instead both samples of *Bucephala clangula* generated a sequence that is rather similar to those obtained from North American and Norwegian samples, but in a phylogenetic tree it falls well outside the species clade. Using alternative primer combinations we obtained the same pseudogene sequence or no amplification at all.

*Figure 2.* Results of the amplification of the COI gene for some birds species using the nested amplification protocol. The PCR products of the nested amplification are visualised on a 0.8% agarose gel. Almost all species tested generate the expected product. The concatamers are indicated with yellow arrows. Red tags indicate the size of the expected amplification products.

The entire dataset of the COI bird sequences has been submitted to the BOLD home page ([www.barcodinglife.org](http://www.barcodinglife.org)) as the barcoding project “Birds of Sweden”.

**Mammals.** Currently no primers suitable for the amplification of COI in all mammals have been proposed. Few studies were dedicated to barcoding mammals, but in all case these studies were focusing on specific taxa (e.g. pikas Lissovsky et al. 2007, bats Clare et al. 2007).

Due to the lack of robust protocols, no sequencing was attempted for mammals. All attempts to use on mammals the published protocols for birds and fishes failed to produce good quality amplification products.

#### 4. Sequencing 16S rRNA

The mitochondrial gene for the 16S rRNA proved to be an excellent marker. The amplification protocol is exceptionally robust, and worked well with almost all samples. The region amplified is a portion of the third domain spanning about 550 bp.

I had problems in only two cases, one mammal and one bird. In birds the primer combination apparently does not produce any amplificate in *Limosa limosa*. However, only one sample is available for this species and a second sample should be tested. In mammals we obtained an aberrant sequence in all four samples of *Sicista betulina*. The last third of the sequence is matching well the sequences of closely related rodents, but the first portion is unreadable due to double peaks along the whole

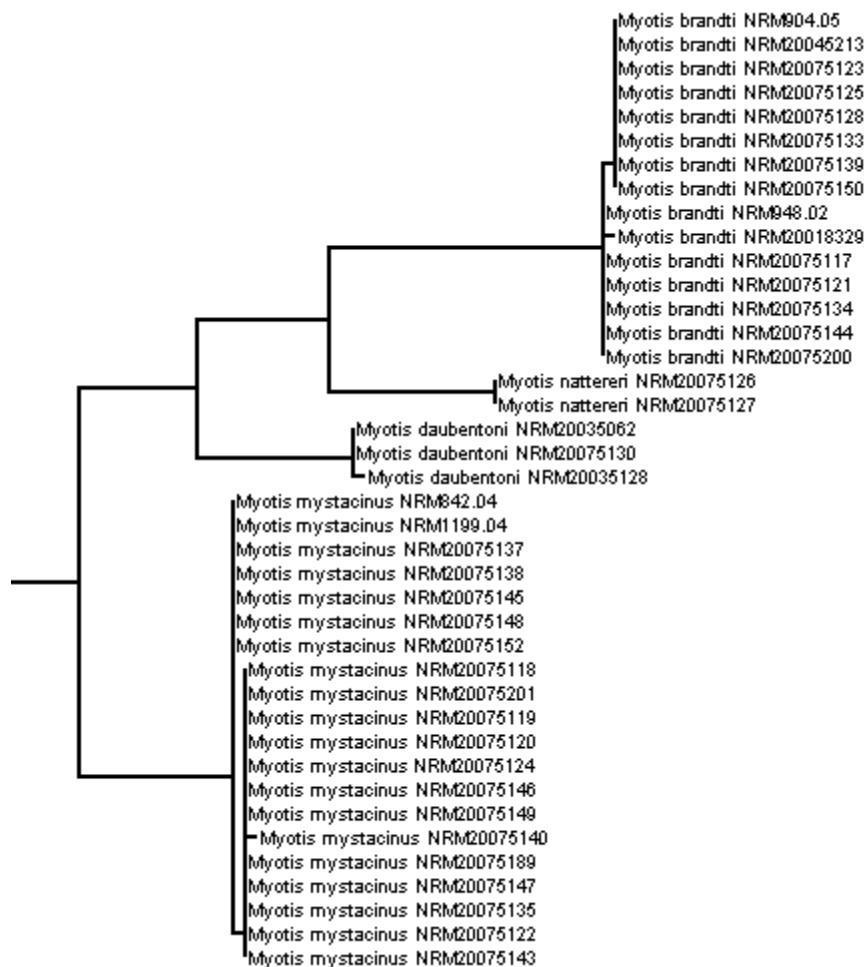

Figure 3. Neighbour-Joining tree of the *Myotis* bats obtained from the 16S rRNA sequences.

chromopherogram. It is likely that in this species the primer combination co-amplifies the target sequence plus a nuclear copy.

In all intraspecific comparisons, the genetic distances within species are null or very, very low. In general, almost all species can be identified using the 16S sequences alone. Few exceptions exist, but these involve species groups that proved to be difficult to separate genetically with any marker (e.g. *Carduelis hornemannii/C. flammea*), or groups showing extensive hybridization and gene introgression (e.g. large *Larus* gulls, *Anser* geese).

The reliability of the 16S rRNA sequences as an identification tool has been tested with a group of bat samples belonging to two species difficult to identify morphologically, *Myotis brandti* and *M. mystacinus*. Some specimens were in poor condition or too young to be confidently identified. The sequencing proved that the 16S sequences are suitable to identify these bat species, with a minimal intraspecific variability (Fig. 3).

The 16S sequences present alternated highly conserved and very variable regions that correspond to the loop and stems of the secondary structure of the 16S rRNA unit. This organization makes the sequences difficult to align in the loop regions, even among closely related species. On the contrary, the stem regions are so conserved that few mutations exist among the Vertebrates (Fig. 4). Thanks to this property of the 16S, we designed a primer couple that can amplify a very short fragment of 120-140bp in all

-----STEM----- | | -----LOOP-----

*Figure 4.* Alignment of a portion of the 16S rRNA sequences of selected vertebrates showing the conserved stem and hypervariable loop regions.

vertebrates. It is especially useful when only short fragment can be amplified via PCR due to degraded DNA. The region covered by this fragment includes a long hypervariable loop and it is suitable for identifying the majority of Vertebrate species at the species level. The primer sequences are:

16SintF: 5'-ACA TAA GAC GAG AAG ACC CTG TGG A-3'  
 16SintR: 5'-CAA GGT CGC CCC AAC CrA A-3'

## 5. Amplification protocols

### Amplification protocol for COI in Fishes

#### Primers:

FishF1: 5'-TCA ACC AAC CAC AAA GAC ATT GGC AC-3'  
 FishF2: 5'-TCG ACT AAT CAT AAA GAT ATC GGC AC-3'  
 FishR1: 5'-TAG ACT TCT GGG TGG CCA AAG AAT CA-3'  
 FishR2: 5'-ACT TCA GGG TGA CCG AAG AAT CAG AA-3'

Key reference: Ward RD, Zemlak TS, Innes BH, Last PR, Hebert PDN. 2005. DNA barcoding Australia's fish species. Philosophical Transactions of the Royal Society of London. Series B, Biological Science, 360: 1847-1857.

#### Amplification profile:

initial denaturation 5' at 95°C  
 35 cycles of denaturation 30" at 95°C, annealing 30" at 55°C, extension 60" at 72°C  
 final extension 8' at 72°C

The primer couple FishF1 and FishR1 is the best primer combination and it works for about 80% of samples. Alternative combinations may be used in case of amplification failure.

### **Amplification protocol for COI in Amphibians and Reptiles**

#### Primers:

LepF1: 5'-ATT CAA CCA ATC ATA AAG ATA TTG G-3'  
 LepRI: 5'-TAA ACT TCT GGA TGT CCA AAA AAT CA-3'

Key reference: Smith MA, Poyarkov NA Jr & Hebert PDN. 2008. CO1 DNA barcoding amphibians: take the chance, meet the challenge. Molecular Ecology Resources 8: 235-246.

#### Amplification profile:

initial denaturation 5' at 95°C  
 35 cycles of denaturation 30" at 95°C, annealing 30" at 52°C, extension 60" at 72°C  
 final extension 8' at 72°C

Notes: the sample tested is small, just 10 species, but it the protocol seems to work well. In only one species, *Rana arvalis*, I never obtained any products (two individual tested).

### **Amplification protocol for COI in Birds**

#### Published primers:

BirdF1: 5'-TTC TCC AAC CAC AAA GAC ATT GGC AC-3'  
 BirdR1: 5'-ACG TGG GAG ATA ATT CCA AAT CCT G-3'  
 BirdR2: 5'-ACT ACA TGT GAG ATG ATT CCG AAT CCA G-3'  
 BirdR3: 5'-AGG AGT TTG CTA GTA CGA TGC C-3'

Key reference: Hebert PDN, Stoeckle MY, Zemlak TS & Francis CM. 2004. Identification of birds through DNA barcodes. PLoS Biol. 2: 1657-1663.

#### Unpublished primers:

CO1-ExtF: 5'-ACG CTT TAA CAC TCA GCC ATC TTA CC-3'  
 CO1-ExtR: 5'-AAC CAG CAT ATG AGG GTT CGA TTC CT-3'

#### Amplification profile: first PCR using CO1-ExtF and CO1-ExtR

initial denaturation 5' at 95°C  
 2 cycles of denaturation 30" at 95°C, annealing 30" at 66°C, extension 50" at 72°C  
 2 cycles of denaturation 30" at 95°C, annealing 30" at 64°C, extension 50" at 72°C  
 16 cycles of denaturation 30" at 95°C, annealing 30" at 62°C, extension 50" at 72°C  
 final extension 8' at 72°C

#### Amplification profile: nested PCR using internal primers

initial denaturation 5' at 95°C  
 4 cycles of denaturation 30" at 95°C, annealing 30" at 64°C, extension 10" at 72°C  
 4 cycles of denaturation 30" at 95°C, annealing 30" at 62°C, extension 10" at 72°C  
 22 cycles of denaturation 30" at 95°C, annealing 30" at 60°C, extension 10" at 72°C  
 final extension 8' at 72°C

Notes: CO1-ExtF and BirdR1 are the best primer combination for the nested PCR. In case of failure, it is possible to use BirdR2. If even the second combination fails, one of the other primer combinations should work.

### **Amplification protocol for 16S rRNA**

#### Primers:

16SARL: 5'-CGC CTG TTT ATC AAA AAC AT-3'  
16SBRH: 5'-CCG GTC TGA ACT CAG ATC ACG T-3'

Key reference: Palumb SR. 1996. Nucleic acids II: The polymerase chain reaction. Pp. 205-247. In: Hillis DM, Moritz C & Mable BK. (Eds.) Molecular Systematics, second edition. Massachusetts: Sinauer.

#### Amplification profile:

initial denaturation 5' at 95°C  
35 cycles of denaturation 30" at 95°C, annealing 30" at 55°C, extension 50" at 72°C  
final extension 8' at 72°C

Notes: it worked well in almost all samples tested. Neither secondary bands nor primer dimmers have been observed.

## 6. Supplementary information

### Samples

To complement the DNA-analyses performed within the project “A DNA key to Swedish vertebrates”, 26 new bird samples, of which one individual had been sampled before (GNM2008-21.562:12), and 18 new mammal samples were analysed for both COI and 16S. The samples were extracted using Molestrips DNA tissue kit (GeneMole) and amplified according to the PCR-profiles below. In addition, all previously extracted mammal samples were analysed for COI, and samples that had failed to amplify for 16S were re-run. Bird samples that had failed to amplify for either COI or 16S were also re-run. No samples of herps or fishes were analysed.

During the process, it turned out that some of the samples seem to have been mislabeled. The species names for the following individuals were changed:

- NRM20018289: This individual has been changed from *Sorex isodon* to *S. araneus* (matches the other *S. araneus* samples for both markers).
- NRM20035128: This individual has been changed from *Myotis mystacinus* to *M. daubentonii* (matches the other *M. daubentonii* samples for both markers).
- NRM20085064: This individual has been changed from *Myodes/Clethrionomys rufocanarius* to *Myopus schisticolor* (matches the other *Myopus schisticolor* samples for both markers)
- NRM20065003 and NRM20065004: These individuals have been changed from *Apodemus sylvaticus* to *A. flavicollis* (matches the other *A. flavicollis* samples for both markers).
- NRM996492: This individual has been changed from *Strix uralensis* to *S. aluco* (matches the other *S. aluco* for both markers).

Some of the accession numbers and specimen details were also found to be incorrect and were changed:

- GNM21562-2 has been changed to GNM2005-21.562:2
- GNM21754-1 has been changed to GNM2006-21.742:1. This individual is a juvenile and not an adult.
- GNM21754-7 has been changed to GNM2006-21.742:7
- NRM.A197310192 has been changed to NRM.A197300192. This individual is a male.
- GNM20600-3 has been changed to GNM2000-20.600:3. This individual is a female.
- NRM20006268: The sex and collection date is unknown for this individual.

Specimen details and sequences for the new bird samples have been submitted to the barcoding project “SWEBI” in the Barcode of Life Data System (<http://www.barcodinglife.org>). Thirty-one of the old bird specimens that were reported as “submitted” (submission dates 2008-11-21, 2007-08-15 and 2008-06-04) could not be found in the SWEBI-project on BOLD (probably not moved/copied from the BISE-project). Of these, four samples did not seem to have worked for COI and one individual was not from Sweden (see excel file “Bird SpecimenData VN120223”). Six of these 31 samples were re-run since the existing sequences were of poor quality.

### Sequencing of COI

**Mammals.** Four new primers (MamF1, MamF2, MamR1, MamR2) were designed for the amplification of COI in mammals. Using the PCR-protocol below, the primer pair MamF1 and MamR1 worked well for the majority of samples and produced single, strong bands. One of the two *Mustela vison* samples (NRM20025118) and the only sample of *Globicephala melas* (NRM20055004) failed to amplify for COI with all primer combinations (but worked for 16S). The four samples of *Microtus agrestis* produced non-matching sequences. Sequences from three of the samples (NRM20075243, NRM20075106,

NRM20085001) resembled previously published sequences of *Microtus agrestis*. However, when one of these samples (NRM20075243) was re-run it produced a non-matching sequence (ca 80 bp mismatch). This sequence resembled the sequence obtained from the forth sample (NRM20025173) but did not match any sequence on BOLD or GenBank.

**Birds.** The primer combination COI-ExtF (Johnsen *et al.* 2010) and VR1 (also called FishR1, Ward *et al.* 2005) worked well for the majority of bird samples and produced single, strong bands. This primer pair was successfully used for most of the new samples and also for six samples that had failed to amplify with other primer combinations (NRM986236 *Luscinia luscinia*, NRM976163 *Sitta europaea*, NRM20006689 *Pluvialis squatarola*, NRM986593 *Dendrocopos minor*, NRM996289 *Streptopelia decaocto*, NRM996391 *Anser erythropus*).

### Sequencing of 16S rRNA

Amplification and sequencing of 16S was performed according to the protocol on page 8 in the original report. All new samples, including a second *Limosa limosa* sample, worked well and produced single, strong bands. The first *Limosa limosa* sample (NRM20016233) was re-run but failed to amplify. One of the three *Sterna caspia* samples (NRM.A1970/10274) and the *Balaenoptera acutorostrata* sample (NRM20035136) that had not worked before were however successfully re-run. The four samples of *Sicista betulina* were also re-run but still produced aberrant sequences, possibly caused by co-amplification of a numt.

### Amplification protocol for COI in Mammals

#### Primers:

MamF1:	5'-TCA GCC ATT TTA CCT ATG TTC AT-3'
MamF2:	5'-TTC TCA ACT AAC CAC AAA GAT ATC G-3'
MamR1:	5'-ACT TCA GGG TGT CCG AAG AAT CA-3'
MamR2:	5'-ACT TCA GGG TGA CCA AAR AAT CA-3'

#### Amplification profile:

Initial denaturation 5' at 95°C

3 cycles of denaturation 30'' at 95°C, annealing 30'' at 58°C, extension 50'' at 72°C

32 cycles of denaturation 30'' at 95°C, annealing 30'' at 56°C, extension 50'' at 72°C

Final extension 8' at 72°C

The primer pair MamF1 and MamR1 was the best primer combination and worked well for most of the samples. Alternative combinations can be used in case of amplification failure.

### Amplification protocol for COI in Birds

#### Primers:

COI-ExtF:	5'-ACG CTT TAA CAC TCA GCC ATC TTA CC-3'
VR1 (FishR1):	5'-TAG ACT TCT GGG TGG CCA AAG AAT CA-3'

- References:

- Ward RD, Zemlak TS, Innes BH, Last PR, Herbert PDN. 2005. DNA barcoding Australia's fish species. *Philosophical Transactions of the Royal Society of London. Series B, Biological Sciences* 360: 1847-1857.

Amplification profile:

Initial denaturation 5' at 95°C

3 cycles of denaturation 30'' at 95°C, annealing 30'' at 64°C, extension 50'' at 72°C

32 cycles of denaturation 30'' at 95°C, annealing 30'' at 62°C, extension 50'' at 72°C

Final extension 8' at 72°C

The primer pair COI-ExtF and VR1 worked well for most of the samples. In case of amplification failure, alternative primers and amplification profiles can be found in the original report.

## 7. Updated list of barcodes of Swedish Vertebrates obtained in the project

The number of samples extracted and the number of COI and 16S sequences obtained for each species. The species for which no samples were obtained are underlined.

Table 2: Samples of Swedish fishes sequenced in the project until June 2012.

Higher taxon	Species	Extracted samples	COI sequences	16S sequences
AMPHIOXIFORMES				
Branchiostomatidae	<i>Branchiostoma lanceolatum</i>	2	1	2
MYXINIFORMES				
Myxinidae	<i>Myxine glutinosa</i>	2	1	1
PETROMYZONTIFORMES				
Petromyzontidae	<i>Lampetra fluviatilis</i>	2	2	2
	<i>Lampetra planeri</i>	2	2	2
	<i>Petromyzon marinus</i>	2	2	2
CHIMAERIFORMES				
Chimaeridae	<i>Chimaera monstrosa</i>	2	2	2
LAMNIFORMES				
Alopiidae	<i>Alopias vulpinus</i> <i>Cetorhinus maximus</i> <i>Lamna nasus</i>			
CARCHARHINIFORMES				
Triakidae	<i>Galeorhinus galeus</i>	2	2	2
	<i>Mustelus asterias</i>	2	2	2
Carcharhinidae	<i>Carcharhinus longimanus</i> <i>Prionace glauca</i>			
Pentanchidae	<i>Galeus melastomus</i>			
Scyliorhinidae	<i>Scyliorhinus canicula</i>	2	2	2
	<i>Scyliorhinus stellaris</i>			
SQUALIFORMES				
Etmopteridae	<i>Etmopterus spinax</i>	2	2	2
Somniosidae	<i>Somniosus microcephalus</i>			
Squalidae	<i>Squalus acanthias</i>	2	2	2
SQUATINIFORMES				
Squatatinidae	<i>Squatina squatina</i>			
RAJIFORMES				
Rajidae	<i>Amblyraja radiata</i> <i>Dipturus batis</i> <i>Dipturus linteus</i> <i>Dipturus nidarosiensis</i> <i>Dipturus oxyrinchus</i> <i>Leucoraja fullonica</i> <i>Leucoraja naevus</i> <i>Raja clavata</i>	2	2	2

<b>MYLIOBATIFORMES</b>				
Dasyatidae	<u><i>Dasyatis pastinaca</i></u>

## PASSERIFORMES

Alaudidae	<i>Lullula arborea</i>	1	1	1
	<i>Alauda arvensis</i>	2	2	2
	<u><i>Eremophila alpestris</i></u>			
Hirundinidae	<i>Riparia riparia</i>	2	2	2
	<i>Hirundo rustica</i>	2	2	2
	<i>Delichon urbica</i>	2	2	2
Motacillidae	<i>Motacilla alba</i>	2	2	2
	<u><i>Motacilla citreola</i></u>			
	<i>Motacilla flava</i>	2	2	2
	<i>Motacilla cinerea</i>	1	1	1
	<i>Anthus campestris</i>	1	1	1
	<i>Anthus trivialis</i>	2	2	2
	<i>Anthus pratensis</i>	2	2	2
	<u><i>Anthus cervinus</i></u>			
	<u><i>Anthus petrosus</i></u>			
	<i>Anthus godlewskii</i>	1	1	1
Regulidae	<i>Regulus regulus</i>	2	2	2
	<i>Regulus ignicapillus</i>	2	2	2
Bombycillidae	<i>Bombycilla garrulus</i>	2	2	2
Cinclidae	<i>Cinclus cinclus</i>	2	2	2
Troglodytidae	<i>Troglodytes troglodytes</i>	2	2	2
Prunellidae	<i>Prunella modularis</i>	2	2	2
Turdidae	<i>Turdus torquatus</i>	1	1	1
	<i>Turdus merula</i>	2	2	2
	<i>Turdus pilaris</i>	2	2	2
	<i>Turdus iliacus</i>	2	2	2
	<i>Turdus philomelos</i>	2	2	2
	<i>Turdus viscivorus</i>	2	2	2
Sylviidae	<i>Locustella naevia</i>	2	2	2
	<u><i>Locustella fluviatilis</i></u>			
	<i>Locustella lusciniooides</i>	1	1	1
	<i>Locustella lanceolata</i>	2	2	2
	<i>Acrocephalus schoenobaenus</i>	2	2	2
	<i>Acrocephalus scirpaceus</i>	2	2	2
	<u><i>Acrocephalus dumetorum</i></u>			
	<i>Acrocephalus palustris</i>	3	3	3
	<i>Acrocephalus arundinaceus</i>	1	1	1
	<i>Hippolais icterina</i>	2	2	2
	<i>Phylloscopus trochilus</i>	2	2	2
	<i>Phylloscopus collybita</i>	2	2	2
	<i>Phylloscopus fuscatus</i>	1	1	1
	<i>Phylloscopus humei</i>	1	1	1
	<i>Phylloscopus sibilatrix</i>	2	2	2
	<i>Phylloscopus proregulus</i>	2	2	2
	<i>Phylloscopus inornatus</i>	2	2	2
	<u><i>Phylloscopus borealis</i></u>			
	<i>Phylloscopus trochiloides</i>	2	2	2

	<i>Sylvia atricapilla</i>	2	2	2
	<i>Sylvia borin</i>	2	2	2
	<i>Sylvia communis</i>	2	2	2
	<i>Sylvia curruca</i>	2	2	2
	<i>Sylvia nisoria</i>	2	2	2
Muscicapidae	<i>Muscicapa striata</i>	2	2	2
	<i>Ficedula hypoleuca</i>	2	2	2
	<i>Ficedula albicollis</i>	2	2	2
Muscicapidae	<i>Ficedula parva</i>	1	1	1
	<i>Erythacus rubecula</i>	2	2	2
	<i>Luscinia luscinia</i>	2	2	2
	<i>Luscinia svecica</i>	2	2	2
	<i>Phoenicurus ochruros</i>	2	2	2
	<i>Phoenicurus phoenicurus</i>	2	2	2
	<i>Saxicola rubetra</i>	2	2	2
	<u><i>Saxicola rubicola</i></u>			
	<i>Saxicola torquata</i>	1	1	1
	<i>Oenanthe oenanthe</i>	2	2	2
	<i>Oenanthe pleschanka</i>	1	1	1
Paradoxornithidae	<i>Panurus biarmicus</i>	2	2	2
Aegithalidae	<i>Aegithalos caudatus</i>	2	2	2
Paridae	<i>Poecile palustris</i>	2	2	2
	<i>Poecile montana</i>	3	3	3
	<i>Poecile cincta</i>	1	1	1
	<i>Periparus ater</i>	2	2	2
	<i>Lophophanes cristatus</i>	2	2	2
	<i>Parus major</i>	2	2	2
	<i>Cyanistes caeruleus</i>	2	2	2
	<i>Cyanistes cyanus</i>	1	1	1
Sittidae	<i>Sitta europaea</i>	2	2	2
Certhiidae	<i>Certhia familiaris</i>	3	3	3
Remizidae	<i>Remiz pendulinus</i>	2	2	2
Oriolidae	<i>Oriolus oriolus</i>	2	2	2
Laniidae	<i>Lanius collurio</i>	2	2	2
	<i>Lanius excubitor</i>	2	2	2
	<u><i>Lanius minor</i></u>			
Corvidae	<i>Perisoreus infaustus</i>	2	2	2
	<i>Garrulus glandarius</i>	2	2	2
	<i>Pica pica</i>	2	2	2
	<i>Nucifraga caryocatactes</i>	3	3	3
	<i>Corvus monedula</i>	2	2	2
	<i>Corvus frugilegus</i>	2	2	2
	<u><i>Corvus corone</i></u>			
	<i>Corvus cornix</i>	2	2	2
	<i>Corvus corax</i>	2	2	2
Sturnidae	<i>Sturnus vulgaris</i>	2	2	2
Emberizidae	<i>Emberiza citrinella</i>	3	3	3
	<u><i>Emberiza hortulana</i></u>			
	<i>Emberiza pusilla</i>	2	2	2
	<i>Emberiza rustica</i>	2	2	2
	<i>Emberiza schoeniclus</i>	3	3	3
	<i>Emberiza calandra</i>	1	1	1

	<i>Calcarius lapponicus</i>	2	2	2
	<i>Plectrophenax nivalis</i>	2	2	2
Fringillidae	<i>Fringilla coelebs</i>	2	2	2
	<i>Fringilla montifringilla</i>	2	2	2
	<i>Pinicola enucleator</i>	2	2	2
	<i>Carpodacus erythrinus</i>	3	3	3
	<i>Loxia pytyopsittacus</i>	2	2	2
	<i>Loxia curvirostra</i>	2	2	2
	<i>Loxia leucoptera</i>	2	2	2
	<i>Carduelis chloris</i>	2	2	2
	<i>Carduelis flammea</i>	2	2	2
	<i>Carduelis hornemannii</i>	3	3	3
	<i>Carduelis spinus</i>	2	2	2
	<i>Carduelis carduelis</i>	2	2	2
	<i>Carduelis flavirostris</i>	1	1	1
	<i>Carduelis cannabina</i>	1	1	1
	<i>Serinus serinus</i>	1	1	1
	<i>Pyrrhula pyrrhula</i>	2	2	2
	<i>Coccothraustes</i>	2	2	2
	<i>coccothraustes</i>			
Passeridae	<i>Passer domesticus</i>	2	2	2
	<i>Passer montanus</i>	2	2	2

Table 4: Samples of Swedish birds sequenced in the project until June 2012.

Higher taxon	Species	Extracted samples	COI sequences	16S sequences
<b>INSECTIVORA</b>				
Erinaceidae	<i>Erinaceus europaeus</i>	2	2	2
Soricidae	<i>Sorex minutissimus</i>	3	3	3
	<i>Sorex minutus</i>	2	2	2
	<u><i>Sorex caecutiens</i></u>			
	<i>Sorex araneus</i>	3	3	3
	<u><i>Sorex sinalis</i></u>			
	<u><i>Sorex isodon</i></u>			
Talpidae	<i>Neomys fodiens</i>	2	2	2
	<i>Talpa europaea</i>	2	2	2
<b>CHIROPTERA</b>				
Myotidae	<i>Myotis mystacinus</i>	20	20	20
	<i>Myotis brandtii</i>	15	15	15
	<i>Myotis nattereri</i>	2	2	2
	<u><i>Myotis bechsteinii</i></u>			
	<i>Myotis daubentonii</i>	3	3	3
	<u><i>Myotis dasycneme</i></u>			
Pipistrellidae	<u><i>Pipistrellus pipistrellus</i></u>			
	<i>Pipistrellus pygmaeus</i>	3	3	3
	<i>Pipistrellus nathusii</i>	2	2	2
Vespertilionidae	<i>Nyctalus noctula</i>	2	2	2
	<i>Eptesicus nilssoni</i>	2	2	2
	<u><i>Eptesicus serotinus</i></u>			
	<i>Vespertilio murinus</i>	2	2	2
	<i>Plecotus auritus</i>	2	2	2
	<u><i>Barbastella barbastellus</i></u>			
<b>CARNIVORA</b>				
Canidae	<i>Canis lupus</i>	2	2	2
	<i>Vulpes vulpes</i>	2	2	2
	<i>Alopex lagopus</i>	2	2	2
	<i>Nyctereutes procyonoides</i>	2	2	2
Ursidae	<i>Ursus arctos</i>	2	2	2
Procyonidae	<i>Procion lotor</i>	1	1	1
Mustelidae	<i>Mustela erminea</i>	3	3	3
	<i>Mustela nivalis</i>	2	2	2
	<i>Mustela vison</i>	2	1	2
	<i>Mustela putorius</i>	2	2	2
	<i>Martes martes</i>	2	2	2
	<i>Gulo gulo</i>	2	2	2
	<i>Meles meles</i>	2	2	2
	<i>Lutra lutra</i>	2	2	2
Felidae	<i>Lynx lynx</i>	2	2	2
Phocidae	<i>Phoca vitulina</i>	2	2	2
	<i>Phoca hispida</i>	2	2	2
	<i>Halichoerus grypus</i>	2	2	2

CETACEA				
Delphinidae	<i>Tursiops truncatus</i>			
	<i>Lagenorhynchus albirostris</i>	2	2	2
	<i>Lagenorhynchus acutus</i>	2	2	2
Phocoenidae	<i>Phocoena phocoena</i>	2	2	2
Balenopteridae	<i>Balaenoptera acutorostrata</i>	3	3	3
	<i>Balaenoptera physalus</i>	1	1	1
Delphinidae	<i>Delphinus delphis</i>	1	1	1
	<i>Globicephala melas</i>	1		1
ARTIODACTYLA				
Suidae	<i>Sus scrofa</i>	2	2	2
Cervidae	<i>Dama dama</i>	2	2	2
	<i>Cervus elaphus</i>	2	2	2
	<i>Alces alces</i>	2	2	2
	<i>Rengifer tarandus</i>	2	2	2
	<i>Capreolus capreolus</i>	2	2	2
Bovidae	<i>Ovibos moschatus</i>	2	2	2
RODENTIA				
Sciuridae	<i>Sciurus vulgaris</i>	2	2	2
Castoridae	<i>Castor fiber</i>	1	1	1
Cricetidae	<i>Lemmus lemmus</i>	2	2	2
	<i>Myopus schisticolor</i>	4	4	4
	<i>Myodes rutilus</i>	1	1	1
	<i>Myodes rufocanus</i>	3	3	3
	<i>Myodes glareolus</i>	2	2	2
	<i>Arvicola terrestris</i>	2	2	2
	<i>Ondatra zibethicus</i>	2	2	2
	<i>Microtus agrestis</i>	4		4
	<i>Microtus oeconomus</i>	1	1	1
Muridae	<i>Apodemus flavicollis</i>	4	4	4
	<i>Apodemus sylvaticus</i>	2	2	2
	<i>Apodemus agrarius</i>	2	2	2
	<i>Rattus norvegicus</i>	2	2	2
	<i>Mus musculus</i>	3	3	3
	<i>Micromys minutus</i>	3	3	3
Gliridae	<i>Muscardinus avellanarius</i>	2	2	2
Dipodidae	<i>Sicista betulina</i>	4	4	
LAGOMORPHA				
Leporidae	<i>Lepus europaeus</i>	2	2	2
	<i>Lepus timidus</i>	2	2	2
	<i>Oryctolagus cuniculus</i>	2	2	2
